

Camera Canvas

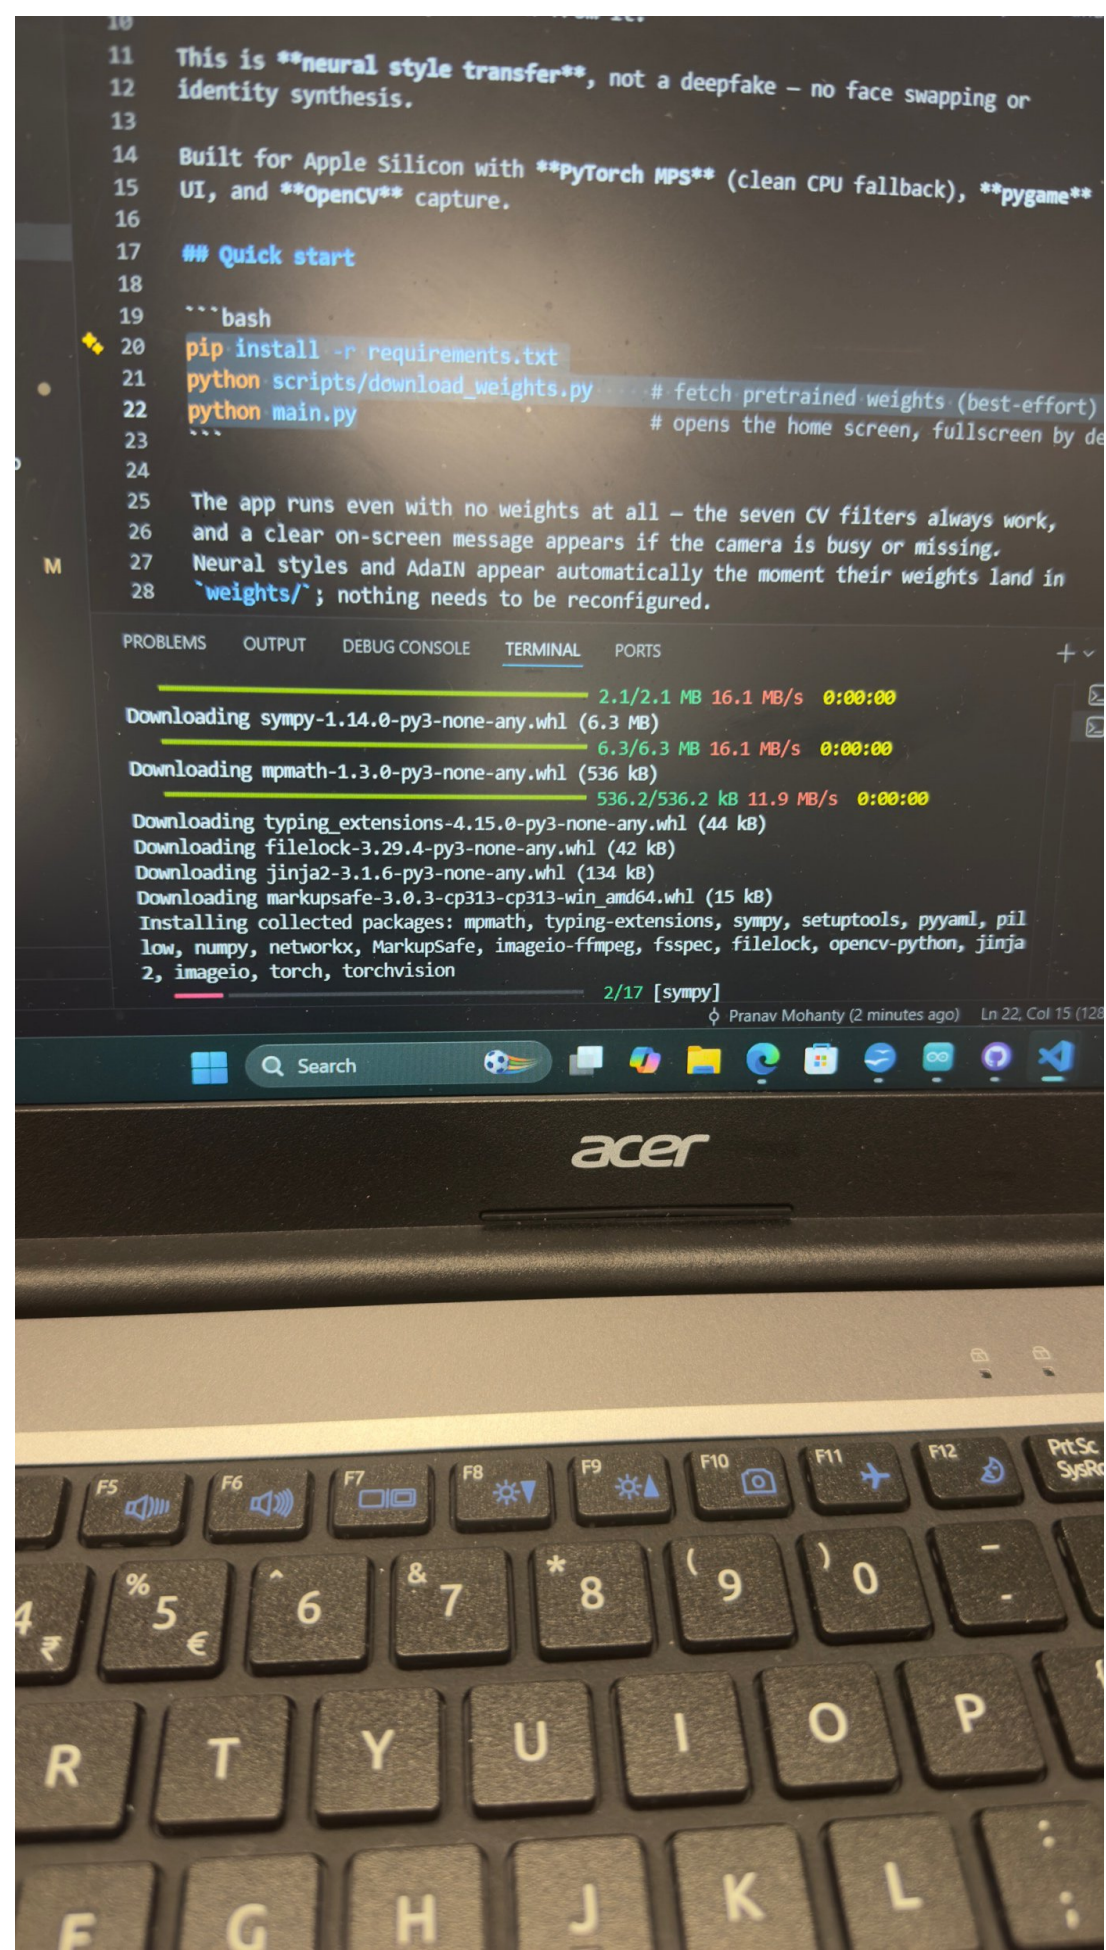

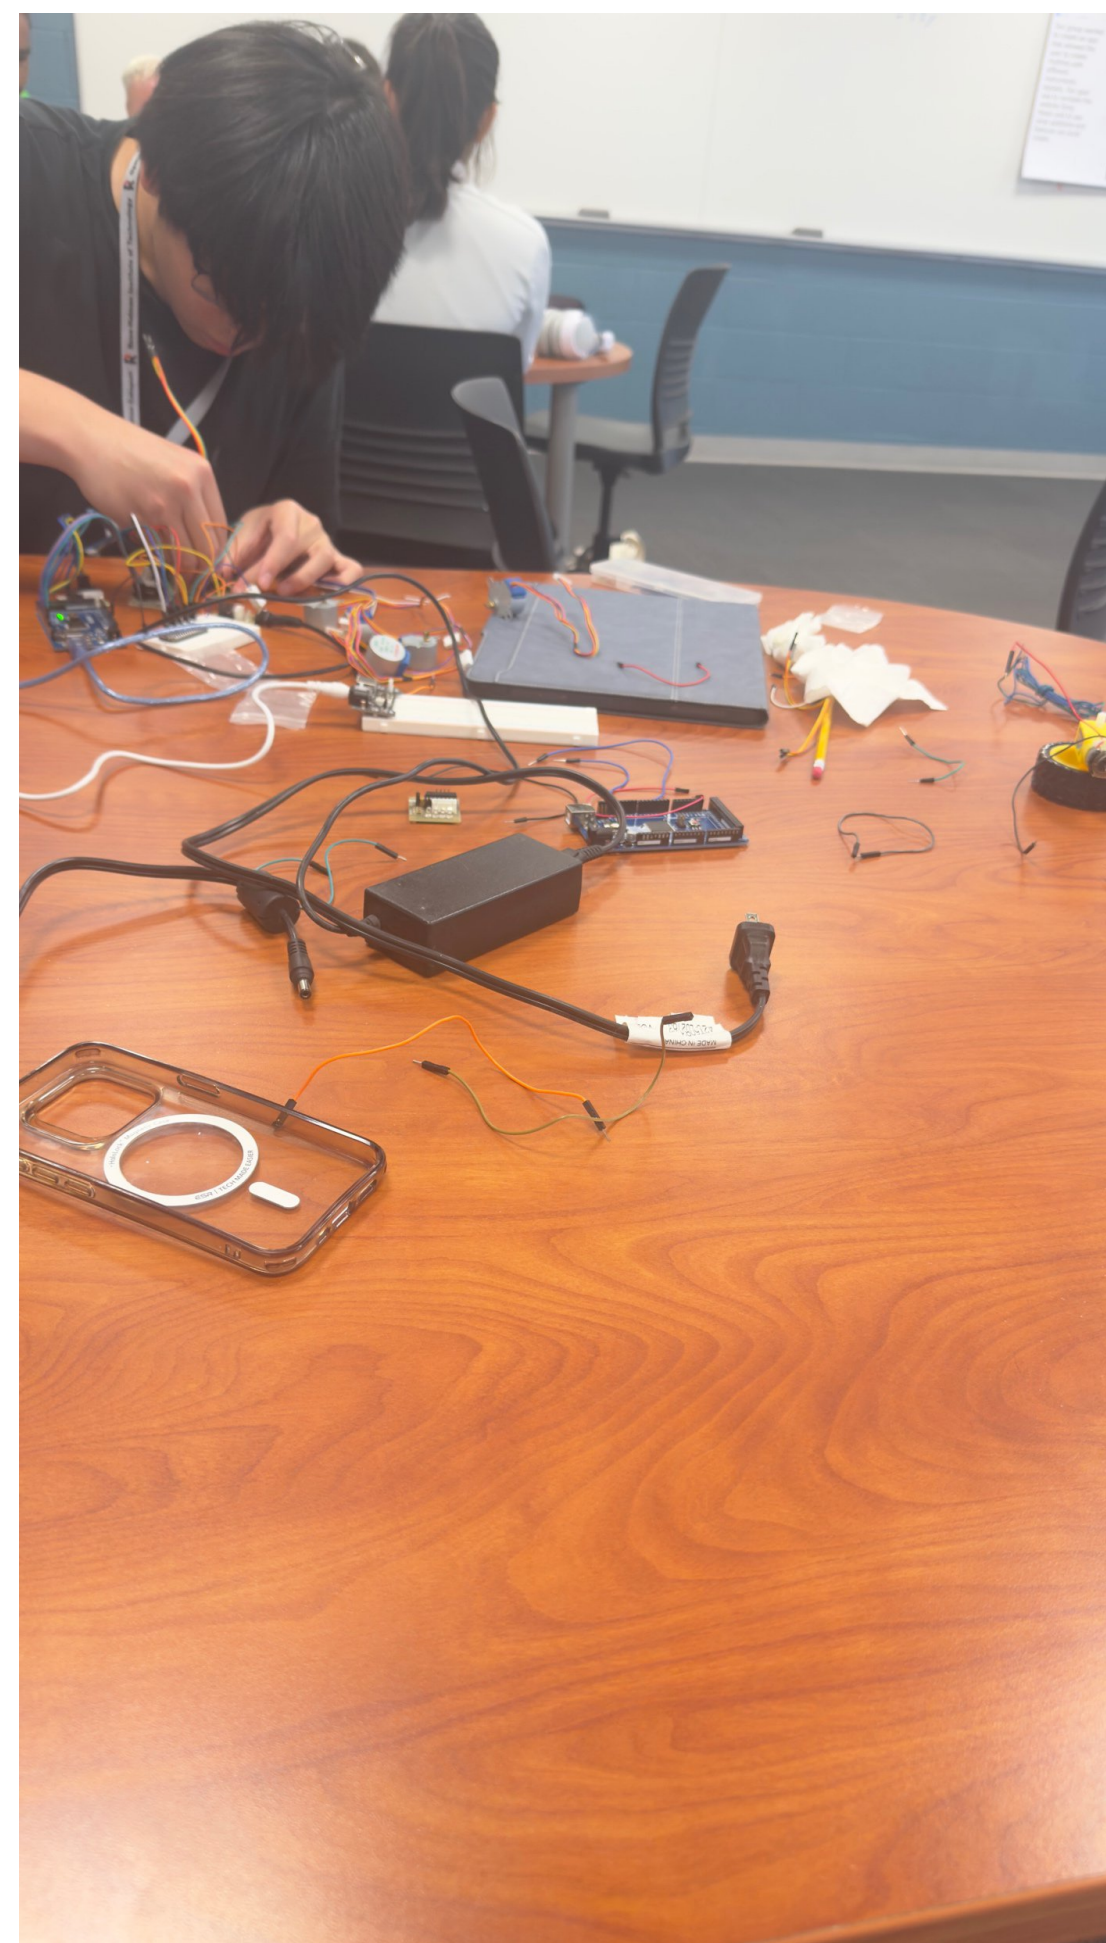

The design Process

Both projects share one goal: turning something normally buried in code into something you control live. The Stepper Mixer is an app that drives five stepper motors at once, each with its own color, slider, and dial, so you can move one precisely or several together. The Style Transfer Webcam does the same for video, restyling your live camera feed into a painting or sketch in real time. One controls motion, the other controls images — but both put instant, hands-on control behind a clean, simple panel.

Motor Mixer

We wanted to build a simple app that lets you take direct control of five stepper motors at once, right from your computer. The idea was to make moving motors feel hands-on and visual — a clean control panel where you can drive each motor on its own, watch what it's doing, and tweak everything live instead of fiddling with code every time.
